2.Summary

BT815/6 with EVE (Embedded Video Engine) technology simplifies the system architecture for advanced human machine interfaces (HMIs) by providing support for display, audio, and touch as well as an object oriented architecture approach that extends from display creation to the rendering of the graphics.

3.General Specifications

■ Size: 5.0 inch

■ Dot Matrix: 800× 3(RGB) × 480 dots

■ Module dimension: 138.7 (W) x 75.8 (H) x 12.8(D)(MAX) mm

■ Active area: 108(W) ×64.8 (H) mm

■ Pixel pitch: 0.135(W) ×0.135(H) mm

■ LCD type: TFT, Normally Black, Transmissive

■ View Direction: 80/80/80/80

■ Aspect Ratio: 5:3

■ Backlight Type: LED,Normally White

■ TFT Controller IC: BT816Q

■ TFT Interface: SPI/QSPI

■ With /Without TP: With RTP

■ Surface: Anti-Glare

*Color tone slight changed by temperature and driving voltage

4.Interface

4.1. LCM PIN Definition (CON 5)

Pin	Symbol	I/O	Function
1	VDD	Р	3.3V power supply input
2	GND	Р	Ground
3	SCK		SPI clock input
4	MISO	0	SPI Single mode: SPI MISO output SPI Dual/Quad mode: SPI data line 1
5	MOSI	Ι	SPI Single mode: SPI MOSI input SPI Dual/Quad mode: SPI data line 0
6	CS	I	SPI slave select input
7	INT	OD/O	Interrupt to host, open drain output(default) or push-pull output, active low
8	PD_N	I	Chip power down mode control input, active low. Connect to MCU GPIO for power management or hardware reset function
9	GPIO2	I/O	General purpose IO 2
10	GPIO3	I/O	General purpose IO 3
11	IO2	I/O	SPI Single/Dual mode: General purpose IO 0 SPI Quad mode: SPI data line 2
12	IO3	I/O	SPI Single/Dual mode: General purpose IO 1 SPI Quad mode: SPI data line 3
13	NC	ı	No connection
14	NC	-	No connection
15	NC	-	No connection
16	NC	,	No connection
17	VLED	P	5V power supply input
18	VLED	P	5V power supply input
19	GND	Р	Ground
20	GND	Р	Ground

4.2. QSPI Interface

The QSPI slave interface operates up to 30MHz. Only SPI mode 0 is supported. The QSPI can be configured as a SPI slave in SINGLE, DUAL or QUAD channel modes. By default the SPI slave operates in the SINGLE channel mode with MOSI as input from the master and MISO as output to the master. DUAL and QUAD channel modes can be configured through the SPI slave itself. To change the channel modes, write to register REG_SPI_WIDTH. The table below depicts the setting.

REG_SPI_WIDTH[1;0]	Channel Mode	Data pins	Max bus speed
00	SINGLE – default mode	MISO, MOSI	30 MHz
01	DUAL	MOSI, MISO	30 MHz
10	QUAD	MOSI, MISO, IO2, IO3	30 MHz
11	Reserved	-	-

Table 1 QSPI Channel Selection

With DUAL/QUAD channel modes, the SPI data ports are now unidirectional. In these modes, each SPI transaction (signified by CS going active low) will begin with the data ports set as inputs.

Hence, for writing to the BT815/6, the protocol will operate as in FT800, with "WR-Command/Addr2, Addr1, Addr0, DataX, DataY, DataZ …" The write operation is considered complete when CS goes inactive high.

For reading from the BT815/6, the protocol will still operate as in FT800, with "RD-Command/Addr2, Addr1, Addr0, Dummy-Byte, DataX, DataY, DataZ". However as the data ports are now unidirectional, a change of port direction will occur before DataX is clocked out of the BT815/6. Therefore it is important that the firmware controlling the SPI master changes the SPI master data port direction to "input" after transmitting Addr0. The BT815/6 will not change the port direction till it starts to clock out DataX. Hence, the Dummy-Byte cycles will be used as a change-over period when neither the SPI master nor slave will be driving the bus; the data paths thus must have pull-ups/pull-downs. The SPI slave from the BT815/6 will reset all its data ports' direction to input once CS goes inactive high (i.e. at the end of the current SPI master transaction).

The diagram depicts the behaviour of both the SPI master and slave in the master read case.

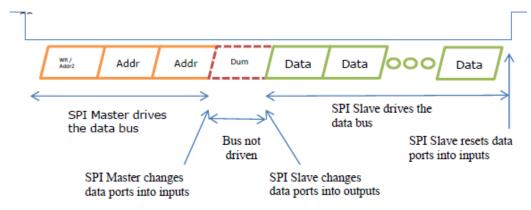

Figure 1 SPI Master and Slave in the Master Read Case

In the DUAL channel mode, MISO (MSB) and MOSI are used while in the QUAD channel mode. IO3 (MSB), IO2, MISO and MOSI are used.

Figure 2 illustrates a direct connection to a 1.8-3.3V IO MPU/MCU with single or dual SPI interface.

Figure 3 illustrates a direct connection to a 1.8-3.3V IO MPU/MCU with Quad SPI interface.

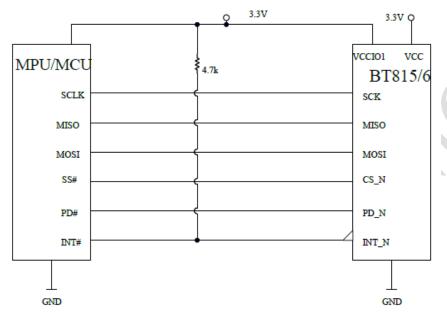

Figure 2 Single/Dual SPI Interface connection

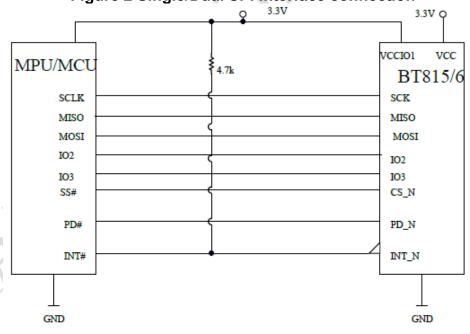

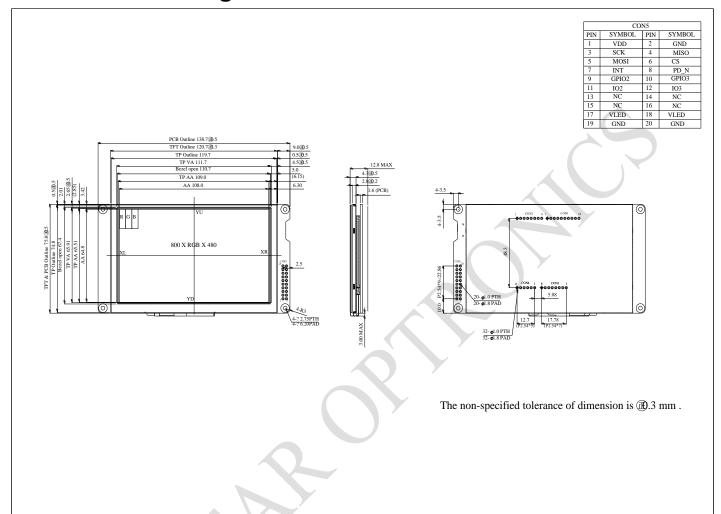

Figure 3 Quad SPI Interface connection

6.Block Diagram

7. Absolute Maximum Ratings

Item	Symbol	Min	Тур	Max	Unit
Operating Temperature	TOP	-20	_	+70	
Storage Temperature	TST	-30	_	+80	

Note: Device is subject to be damaged permanently if stresses beyond those absolute maximum ratings listed above

1. Temp. □60□, 90% RH MAX. Temp. >60□, Absolute humidity shall be less than 90% RH at 60□

8. Electrical Characteristics

8.1. Operating conditions:

Item	Symbol	Condition	Min	Тур	Max	Unit	Remark
Supply Voltage For VDD	VDD	_	3.1	3.3	3.5	V	_
Supply Current For VDD	IDD	VDD=3.3V	_	96	144	mA	Note1
Supply Voltage For VLED	VLED	_	4.5	5	5.5	V	5
Supply Current For VLED	ILED	VLED=+5V	_	334	500	mA	Note1

Note 1 : This(Typ) value is test for VDD=3.3V ,VLED=+5V , Ta=25 °C only

8.2. Backlight PWM conditions

Parameter	Min.	Тур.	Max.	Unit	Remark
PWM Control Duty Ratio	0	-	100	%	Note 4,5,6
PWM Control Frequency	250	-	10K	Hz	
LED Life Time	-	50,000	-	Hr	Note 1,2,3

Note 1: Ta = 25 °C

Note 2: Brightness to be decreased to 50% of the initial value

Note 3: The single LED lamp case

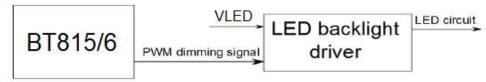

Note 4: Turn ON the backlight when PWM =Low, Turn OFF when PWM =High

Note 5 : PWM Low Active Control from lowest brightness to highest brightness

Note 6: Backlight PWM signal is internally connected to BT815/6 backlight control pin, This pin is controlled by BT815/6 registers

Note 7: The backlight dimming control pin (BACKLIGHT) is a pulse width modulated (PWM) signal controlled by two registers: REG_PWM_HZ and REG_PWM_DUTY. REG_PWM_HZ specifies the PWM output frequency, the range is 250-10000 Hz. REG_PWM_DUTY specifies the duty cycle; the range is 0-128. A value of 0 means that the PWM is completely off and 128 means completely on.

The BACKLIGHT pin will output low when the DISP pin is not enabled (i.e. logic 0).

8.3. SPI Operating conditions

Davamatav	Symbol		Rating		l lnit	Condition	
Parameter	Symbol	Min	Тур	Max	Unit	Condition	
Low level input voltage	VIL	0	-	0.3VDD	V	\/DD-2 2\/	
High level input voltage	VIH	0.7VDD	-	VDD	V	VDD=3.3V	

9.AC Characteristics

9.1. SPI Interface Timing(SPI MODE 0 Only)

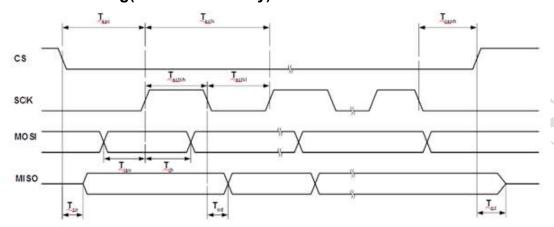

Figure 1 SPI Interface Timing

		VDD=	3.3V	
Parameter	Description	Min	Max	Units
Tsclk	SPI clock period (SINGLE/DUAL mode)	33.3		ns
Tsclk	SPI clock period (QUAD mode)	33.3		ns
Tsciki	SPI clock low duration	13		ns
Tsclkh	SPI clock high duration	13		ns
Tsac	SPI access time	3		ns
Tisu	Input Setup	3		ns
Tih	Input Hold	0		ns
Tzo	Output enable delay		11	ns
Toz	Output disable delay		10	ns
Tod	Output data delay		11	ns
Tcsnh	CSN hold time	0		ns

Table 1 SPI Interface Timing Specifications

For more information about BT815/6 controller please go to official BT81x website. https://brtchip.com/bt81x

9.2. Internal Regulator and POR(Power-On-Reset)

The internal regulator will generate a Power-On-Reset (POR) pulse when the output voltage rises above the POR threshold. The POR will reset all the core digital circuits; It is possible to use the PD_N pin as an asynchronous hardware reset input. Drive PD_N low for at least 5ms and then drive it high will reset the BT815/6 chip.

9.3. Power Modes

When the supply to VDD is applied, the internal regulator is powered by VDD. An internal POR pulse will be generated during the regulator power up until it is stable. After the initial power up, the BT815/6 will stay in the SLEEP state. When needed, the host can set the BT815/6 to the ACTIVE state by performing a SPI ACTIVE command. The graphics engine, and the touch engine are only functional in the ACTIVE state. To save power the host can send a command to put the BT815/6 into any of the low power modes: STANDBY, SLEEP and POWERDOWN. In addition, the host is allowed to put the BT815/6 in POWERDOWN mode by driving the PD_N pin to low, regardless of what state it is currently in. Refer to Figure 2 for the power state transitions.

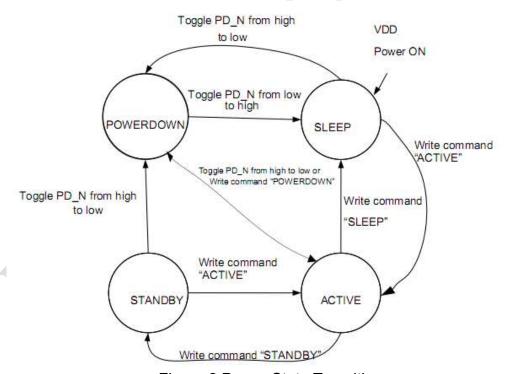

Figure 2 Power State Transition

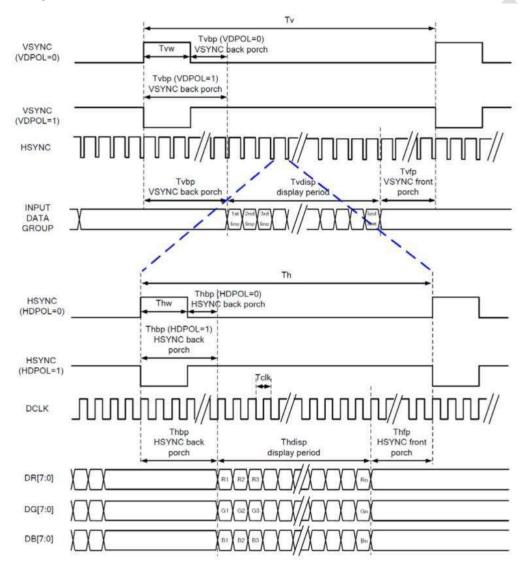

10.Timing Characteristics

Ta=25±2°C

Note 1: Definition of viewing angle range

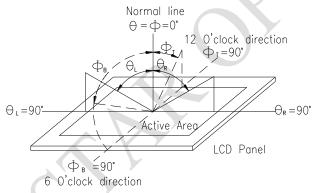

Fig. 11.1. Definition of viewing angle

Note 2: Test equipment setup:

After stabilizing and leaving the panel alone at a driven temperature for 10 minutes, the measurement should be executed. Measurement should be executed in a stable, windless, and dark room. Optical specifications are measured by Topcon BM-7or BM-5 luminance meter 1.0° field of view at a distance of 50cm and normal direction.

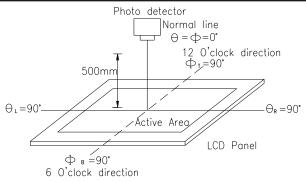

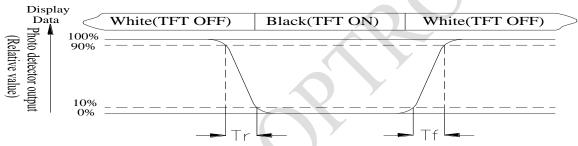

Fig. 11.2. Optical measurement system setup

Note 3: Definition of Response time:

The response time is defined as the LCD optical switching time interval between "White" state and "Black" state. Rise time, Tr, is the time between photo detector output intensity changed from 90%to 10%. And fall time, Tf, is the time between photo detector output intensity changed from 10%to 90%

Note 4: Definition of contrast ratio:

The contrast ratio is defined as the following expression.

Note 5: Definition of Luminance Uniformity

Active area is divided into 9 measuring areas (reference the picture in below). Every measuring point is placed at the center of each measuring area.

Luminance Uniformity (U) = Lmin/Lmax x100%

L = Active area length

W = Active area width

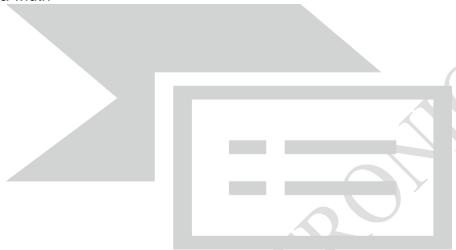

Fig11.3. . Definition of uniformity

Note 6: Definition of color chromaticity (CIE 1931) Color coordinates measured at the center point of LCD

Note 7: Measured at the center area of the panel when all the input terminals of LCD panel are electrically opened.

12.Reliability

13.Touch Panel Information

13.1. Resistance Touch Panel General Specifications

Item	Description
Insulating resistance	$>$ 20M Ω \cdot 25V(DC)
Light transparence	Min 70%
Structure type	Anti-Glare
X resistance	200~1200Ω
Y resistance	100~900Ω

14.Initial Code For Reference

 This should be calibrated the value of RTE(Resistive Touch Engine) via internal command from CMD_CALIBRATE. After the calibration process is completed, the registers REG_T OUCH_TRANSFORM_A-F (in BT816Q) will be updated accordingly.
