Certificates

Year 1938

That year, Piotr Pętlak, grandfather of nowadays ERKO owners, and a father of the Company founder, opens forge.

That is the foundation of the multi-generation family profession in the field of metal processing.

Decades later

in 1981 one of the sons- Roman Pętlak started his own business. In Jonkowo near Olsztyn, Warmia region, craft business was founded related to manufacturing of agricultural tools.

In 1986 along start of production of cable lugs for shipbuilding industry, the company is reorganized. As a result of dynamic growth of the company, brothers: Roman, Jan and Józef decide to open second branch in a hometown Czeluśnica near Jasło. Further intensive activities, improvement of technology, innovation of products and a high standard of production were confirmed by receipt of the first in Poland Certificate according to ISO-9001.

Design department launched,

begins work on the implementation of the new assortment group - tools for crimping. This is very important stage of development, it is a beginning of a new philosophy of the Company.

In following years Erko implements the Integrated Quality and Environment Management System according to the standards of ISO 9001 and ISO 14001 and carries a series of certifications for compatibility with the requirements of GOST-R and UkrSEPRO. In 2003 first CNC machines are activated, and in 2007 ERP system supporting management of the manufacturing company is implemented. Next year brings a title of the Regional Leader in Innovation. Achieving this prestigious title was possible due to the intensive development of the company, which was supported by European Union grants.

In 2010

ERKO joins to The Aviation Valley Association. A year later company receives quality certificate (for aviation production) AS 9100 and starts production of parts for aircrafts engines.

The WSK "PZL-Rzeszów" SA was the first customer. While production of parts was expanding, also production of tooling was improved. Investments in machines enabled to extend the range of activities of mechanical processing. Our main customers are Pratt & Whitney Rzeszów, Tubes Pratt & Whitney and MTU Aero Engines Poland.

Single indent for copper terminals without insulation made according to DIN 46234 and pin terminals made according to DIN 46230 for wire of cross section of $0,5 \div 120 \text{ mm}^2$, and for copper tubular terminals for wire of cross section of $0,5 \div 6 \text{ mm}^2$ (e.g. KOA, KWA, KLA).

Oval for copper ring terminals with polyamide insulation made according to DIN 46237 and DIN 46234, for copper pin terminals with polyamide insulation made according to DIN 46230 and DIN 46231 for wire of cross section of $0,5 \div 120 \text{ mm}^2$ (e.g. KOE, KWE) and for insulated receptacles and tabs (MSE, TSE).

Trapezoidal for copper cable end-sleeves made according to DIN 46228 Part 1 and Part 4 and double copper cable end-sleeves for wire of cross section of $0,5 \div 185 \text{ mm}^2$ (e.g. TA, TE, TV).

Square for copper cable end-sleeves made according to DIN 46228 Part 1 and Part 4 and double copper cable end-sleeves for wire of cross section of $0,5 \div 10 \text{ mm}^2$ (e.g. TA, TE, TV).

Wrapped over wire conductor and insulation, for brass terminals made according to DIN 46247, DIN 46248 and DIN 46225 for wire of cross section of $0,5 \div 6 \text{ mm}^2$ (e.g. MS, TS, KOP, KNP).

Round forming of aluminum sector conductors of cross section of $25 \div 300 \text{ re}$, $16 \div 240 \text{ rm}$ for aluminum terminals. re – singlestrand wire cross section in mm^2 , rm – multistrand wire cross section in mm^2

Hexagonal for copper and aluminum terminals and connectors for wire of cross section of $6 \div 625 \text{ mm}^2$ (profile according to DIN 48083).

Crimping of terminals and connectors:

1. Select terminal or connector appropriate for the wire (cross section, material, type of wire).
2. Determine proper form of crimping.
3. Strip the cable to the same length as tubular part of terminal.
4. Before crimping the wire must be cleaned of oxides and corrosive deposits.
5. Insert the wire to the end of tubular part of terminal or to connector narrowing.
6. Choose appropriate tool and dies (check last column of terminals sizes charts).
7. Keep crimping until dies clamp or overflow valve of hydraulic drive responds.
8. Crimping may be single (e.g. KOE, KOA) or multiple (e.g. KCR, KLA). Copper and aluminum tubular terminals made according to DIN have marks for crimping as shown below (fig.):

9. It is essential to keep the direction of crimping terminals and connectors as shown below (fig.):

NOTE

Tools and terminals system provided by ERKO ensures high performance throughout the period of use. The use of third-party products (made in accordance with other standards) may cause much lower quality connections.

SHARK connectors

for winding enameled and non-enameled Cu and Al wires

SHARK technology is dedicated to connect winding enameled wires in motors and oil transformers, copper and aluminum wires, round and rectangular wires. We provide technical advice by recommending Shark connections and other configurations according to arrangements with customer.

- **Quality of connection**
Connections made with Shark connectors conform with the requirements of PN-EN 61238 -1 standard, and have been awarded a certificate issued by Electrotechnical Institute from Warsaw.
- **Durable connection**
Connections made with Shark connectors have been in use in transformers for over 10 years.
- **Clean technology**
Thank to use of Shark technology, process of removing enamel insulation from the wires has been eliminated. When connecting wires there is no need to secure the transformer against generated impurities.
- **Environment friendly technology**
Shark connector fast and reliably replaces harmful to the environment soldering and enamel insulation burning processes.
- **Easy operation**
Dedicated and efficient tools and ERKO team help in preparing technology, enable trouble free implementation of Shark technology at customer's plant.
- **Increased efficiency**
All our customers who implemented Shark technology gained a significant increase in performance comparing to previously used technology.
- **Economical technology**
Elimination of preparatory processes, energy consuming soldering process, reduction of stored connectors range, high efficiency of the process makes Shark technology more beneficial than traditional methods.
- **Universal technology**
With one Shark connector one can make connection using wires of different cross-section, shape and material. Having over a dozen of connectors, any wire within scope of Shark connectors can be connected. We are able to recommend alternative connection solution for any presently used by customer.

In connection made with Shark technology, teeth of the connector bite through the enamel and into the core of connected wires. Therefore made connection is electrically and mechanically reliable.
